Oi and Paul Shuldiner. 1962. 281 pp., index, tables, bibliography. The Transportation Center - Northwestern University.

A study of travel demands by urban residents, and their expenditures for transportation, together with a critical evaluation of "origin-and-destination" study procedures. The book contains more than 65 tables and illustrative diagrams. Home interview surveys in Detroit and Modesto (California) furnished the data on causal factors in urban travel demands. The expenditures data represent urban families in some thirty

cities at three widely separated points in time. New conclusions are reached which differ from those reported in earlier trip generation studies.

STANDARDS FOR STREET FACILITIES AND SERVICES

Basic Issues in Chicago Metropolitan Transportation. by Edwin T. Haefele. 1958. 55 pages. The Transportation Centre. Northwestern University.

A study of the problems in Chicago transportation, both public and private, and of the extent and nature of public responsibility and policy for transportation. Specific recommendations for public policy are made, especially concerning the financing of highways and the Chicago Transit Authority. The appendixes furnish data on demand for transportation; present passenger load, distribution, and revenue; highway costs and user payment; and various payments to government by Chicago motorists.

Growth and Change in Metropolitan Areas and Their Relationship to Metropolitan Transportation. by Mark Reinsberg. 1961
23 pages, softbound. No charge.

An interpretation of the closely-related Center studies on metropolitan transportation, this monograph examines the decline of mass transit, the role of the private automobile, and the impact of both on city economic life. The essay illustrates how the desire of Americans for personal mobility,

together with the "tug-and-pull between central cities and their suburban areas for population and industry" has intensified the transportation problem of major metropolitan areas in this country.

Highway Benefits: An Analytical Framework. by Herbert D. Mohring and Mitchell Harwitz. 1962. 203 p., index. \$6.50

Presents recently developed analytical tools for measuring the advantages of highway improvements to the general economy and to special beneficiary groups. The study also examines the effects of highway investment on land values, and how the magnitude and distribution of benefits are affected by alternative financing systems. The book is both timely and significant for those interested in appraising the impact of the Federal Interstate System on the economy.

The Transportation Center - Northwestern University

An econometric study of certain aspects of an individual's choice among urban modes of travel, based on a metropolitan survey. Relative costs, times, and income of the trip taker are studied in relationship to choices between: automobile and suburban train, and suburban train and city mass transit. Also considered is the difference in choice made for work trips and non-work trips to the central business district.
